

TARIQ HUSSAIN

role = "IT & Enterprise Applications";

IT Operations Specialist / BMW Nederland

STRENGTHS

- Service delivery with partners
- Requirements into specifications
- Governance and security
- Continuity and recovery
- Data and reporting
- AI tooling for teams

tariqarifhussain@gmail.com | +31 6 31151954 call & WhatsApp | LinkedIn | Portfolio | DeskOps tour

01 PROFILE // profile.php

Experienced enterprise applications professional connecting business needs with IT solutions.

Currently overseeing BMW Nederland's production IT applications, combining functional ownership of business-critical systems with requirements analysis and system design. Acts as the **linking pin between business owners, internal IT teams, and external vendors**. Gathers what the business actually needs, judges what the existing landscape can support, and translates it into technical specifications. Carries each change through configuration, testing, and release, governed by a review board with impact analysis, without disruption to the people who depend on it. Recognised for keeping enterprise platforms dependably available and holding service partners **TCS and IBM** to their agreed service levels. Redesigned how incidents are handled so that **recovery time fell by a quarter**, and designed and built **Beacon**, an incident-response platform that joins ServiceNow, Jira and Confluence to BMW's internal LLM platform. Planned a **data warehouse migration** across two country organisations, estimated object by object. Manages the full lifecycle of an application, from onboarding against enterprise architecture standards through daily operation and integration monitoring to eventual migration. Served previously as functional owner and **single point of contact for the Unit4 ERP estate at Haskoning**. Independently designed and built **DeskOps**, a complete service management and ERP platform on a **relational schema of over 300 tables and views**, with role-based security enforced at the endpoint. Brings a security-conscious approach to integration and access, having implemented **single sign-on and automated provisioning at enterprise scale**, and built a **Windows Server Active Directory domain with LDAPS and an enterprise certificate authority** in a lab, connected to DeskOps for directory synchronisation. Pioneers the selective adoption of AI where it genuinely helps a business run better. Combines deep technical fluency in data modelling, integration, and information security with strong business acumen drawn from prior marketing, finance, and project-management roles, delivering clear, persuasive communication to stakeholders at all levels.

02 BY THE NUMBERS // stats.json

9+
years in IT, from internships to BMW Nederland

4
business-critical applications owned end to end at BMW

11
containers in a self-hosted knowledge-base stack at BMW

−25%
mean time to restore at BMW Nederland

10+
technical teams brought under one recovery plan

300+
tables and views in DeskOps, a CMDB among them

03 CAREER AT A GLANCE // git log --oneline

2017 - 2019 — **Developer & analyst internships**
OCS Consulting, Antenna Company, Zetes

2019 - 2020 — **Data Analyst**
Global University Systems, Berlin

2022 — **Power BI Consultant**
LionRock Maritime, freelance

2022 - 2024 — **IT Operations Analyst & Daily Manager**
Haskoning, Amersfoort

2024 → — **DeskOps**
Independent build, PHP 8 and MySQL

2025 → — **IT Operations Specialist**
BMW Nederland, Rijswijk

04 TOOLBOX // ways of working

Service operations
- ServiceNow
- incident & problem
- change & release
- escalation playbooks

Partners & delivery
- vendor management
- service KPIs
- root-cause review
- requirements

Risk & continuity
- RTO & RPO
- DR & ITSCM
- RSA Archer
- ISO 27001

Identity & infrastructure
- Entra ID
- Active Directory
- SSO & SCIM
- Docker & Compose

Data & platforms
- Power BI
- SQL
- Data Vault
- Unit4 & Dynamics

Automation & AI
- Python & FastAPI
- retrieval (RAG)
- MCP
- n8n

05 SELECTED ACHIEVEMENTS // highlights

Recovery time cut by a quarter
Slow priority-one recovery traced to unclear ownership at each handoff rather than slow response; runbooks put under version control and escalation rebuilt around clear decision points.

Partners held to service levels
TCS and IBM directed against agreed service levels, with priorities turned into clear task queues, execution tracked to closure, and escalation when delivery falls behind.

Governance made routine
Applications onboarded against architecture standards, every change through a review board, and security and privacy records kept current on RSA Archer in line with ISO 27001.

Ten teams, one recovery plan
An enterprise disaster recovery exercise in the Netherlands and Belgium: more than ten technical teams, dependencies and risks managed, through to formal sign-off.

Complex incidents resolved
An application-wide freeze traced to blocking calls starving the event loop and fixed under live load; container and DNS faults resolved through process-tree and connection analysis.

AI put to practical use
Beacon joins ServiceNow, Jira and Confluence to BMW's internal LLM platform; a self-hosted knowledge base answers questions over internal documentation with no data leaving the company.

06 EMPLOYMENT HISTORY // experience

IT OPERATIONS SPECIALIST
01-2025 → present

BMW Nederland B.V., Rijswijk, The Netherlands

- Lead full-time production support, with **IBM and TCS** as delivery partners, for BMW NL's strategic applications: MINI IDE, Logilink for credit decisions, Carbon Tracker for emissions analytics, and Flexible Fleet for fleet management, holding them to agreed service levels across the incident, change, problem and release queues in **ServiceNow** under ITIL governance.
- Serve as the first point of contact between business owners and internal IT, establishing what is actually required from problem descriptions, judging what the existing architecture will support, writing specifications for engineering, and sequencing work into the backlog.
- Manage the formal onboarding of applications into BMW's standardised IT landscape against enterprise architecture standards, agreeing functional and operational requirements before production, and lead roll-outs of configuration changes and version upgrades across infrastructure, development and security teams with **zero customer-facing downtime**.
- Set and track service KPIs across the incident, change, problem and release queues, keep the ITIL audit logs, and chair the root-cause reviews whose findings are carried into a continuous-improvement backlog.
- Introduced Git-versioned operational runbooks and tiered escalation playbooks after tracing slow priority-one recovery to unclear ownership at each handoff rather than to slow response, **reducing mean time to restore by a quarter**.
- Respond to nightly Informatica PowerCenter failure alerts, investigate them in Workflow Monitor, and coordinate fixes with developers so that the next day's data-warehouse loads arrive on schedule.
- Took over operations management of the MINI IDE application from BMW headquarters, the Netherlands being its only market: handled its incidents and certificate renewals, and steered an iterative rewrite with **IBM**.

Beacon, incident-response platform (Python / FastAPI)

- Designed and built **Beacon**, a Git-versioned incident-response platform in which runbooks and escalation playbooks are held as version-controlled content with diff and one-click revert, so that the process which cut priority-one recovery time by a quarter survives daily use.
- Integrated Confluence, Jira, ServiceNow and BMW's internal LLM platform behind a single interface, reaching ServiceNow through a Dockerised **Model Context Protocol** client with **OAuth2 client-credentials** flows, and grounding AI-assisted drafting in live content rather than free generation.
- Diagnosed an application-wide freeze caused by blocking calls starving the asynchronous event loop, offloaded the work to a thread pool, and verified the fix under live concurrent load; resolved container and DNS faults on the same infrastructure through process-tree and connection analysis.

Data migration & architecture

- Plan the migration of REDS, BMW Nederland's Data Vault 2.0 warehouse on Oracle and PowerCenter, with two routes estimated object by object across its storage objects: a lift-and-shift of the existing two-step Dutch architecture, or translation into Belgium's single-step target on Snowflake, DBT and AWS Glue. The hybrid design that followed draws on both.

Service continuity, risk & governance

- Determine the **recovery time and recovery point objectives** and the criticality of each production instance through its Service Impact Assessment, recorded in ServiceNow CSDM since November 2025; the resulting tier dictates the architecture and tested recovery procedures each application must have.
- Keep each application's **threat assessment**, security conformity statement, **SAST** and penetration-test status, IAM conformity, information classification and privacy impact assessment current, together with its record in **DaGoN**, BMW Group's data-governance register of data-quality controls and vendor involvement.
- Coordinated an enterprise disaster recovery exercise for critical financial services applications across the Netherlands and Belgium, managing dependencies across **more than ten technical teams** through to formal ITSCM sign-off.

Emerging technology evaluation

- In the BMW NL IT AI Core Team, weigh new technologies on feasibility, cost, latency, data residency and governance risk, and build the proof of concept each decision turns on.
- Designed and deployed a self-hosted knowledge base that lets teams query internal Confluence documentation in natural language: retrieval-augmented generation orchestrated in **n8n**, with **Qdrant** for vectors and **Ollama** for local inference, across an **11-container Docker Compose stack**, with unattended daily ingestion and no data leaving the corporate environment.

IT OPERATIONS ANALYST AND DAILY MANAGER

09-2022 → 09-2024

Haskoning, Amersfoort, The Netherlands

- Functional owner of the Unit4 ERP estate used across Haskoning worldwide, and the **single point of contact** for ERP tickets and complex user queries.
- Extended Microsoft Dynamics 365 through **Power Apps** and **Power Automate**, and implemented **single sign-on and SCIM provisioning** for Docker Business at enterprise scale.
- As Daily Manager, directed the team's daily work, coached colleagues and organised the team's schedules.
- Developed and tested custom features for the Unit4 ERP alongside internal teams, translating requirements into specifications and validating each release with its users, and aligned the in-house teams to Agile and Scrum through Jira and Microsoft DevOps.
- Converted recurring issues into architectural improvements, turning ticket patterns into a prioritised improvement backlog with the development team so that problems were resolved at their source.
- Led an analytics team in building a relational database on **Microsoft Azure Data Lake**, fed through Azure REST APIs with automated ingestion for Power BI.

POWER BI CONSULTANT, FREELANCE

04-2022 → 06-2022

LionRock Maritime, Amsterdam

- Improved predictive machine-learning models through tailored problem statements, and built the interactive Power BI reporting on which LionRock Maritime's clients relied.

DATA ANALYST, DIGITAL MARKETING

10-2019 → 02-2020

Global University Systems (GUS), Berlin, Germany

- Weekly lead and sales reporting modelled from Microsoft Dynamics 365, streamlined into Power BI templates.

DEVELOPER & ANALYST INTERNSHIPS

02-2017 → 02-2019

For Fontys University of Applied Sciences

OCS Consulting B.V.
's-Hertogenbosch · 2018 - 2019

Delivered **OCS Contract System**, a web application for client information adopted for everyday use, built in **PHP and SQL** across time-boxed Agile stages.

Antenna Company B.V.
Eindhoven · 2018

Requirements analysis for Microsoft Dynamics NAV across six stakeholder groups, and an IBCS-standard dashboard on Dynamics NAV data.

Zetes Netherlands
Son-en-Breugel · 2017

Optimised Salesforce for sales and specified a module removing manual marketing steps.

07 EDUCATION // degrees

University of Europe for Applied Sciences, Berlin

MSc Corporate Management · 2020 · grade 1.4

Strategy and Governance, Corporate Finance, Corporate Change and Alignment.

Thesis: How Blockchain-Based Smart Contracts Can Improve Invoicing Accuracy (95/100).

Fontys University of Applied Sciences, Eindhoven

BSc ICT & Business · 2019

System Development, Data Warehousing, IT Service Management (ITIL), Service-Oriented Architecture.

Capstone: Web Application for Managing Clientele Information, OCS Consulting.

08 INDEPENDENT BUILD: DESKOPS // side project since 2024

A service management platform with an ERP module, designed and built alone since September 2024 in PHP 8 with strict typing on a layered architecture, working with AI coding agents under my own design, specification and review: **twenty-nine modules in five families, over 300 tables and views, 590 API endpoints, 78 screens and over 1,400 commits**. Built for research and demonstration, using no employer data. Full technical tour of the DeskOps suite.

- Configuration management: A CMDB cataloguing items by class with typed dependencies, state transitions and a per-item audit trail, a topology view of impact paths and a blast-radius check before any change; operational documents under version control with diff and single-click revert, and change workflows routed by risk.
- Service and project management: Full incident lifecycle tracking against real working-hour service-level targets with integrated knowledge articles. Every task is traced to business objectives, prioritised, and forecast from the team's measured pace.
- Security architecture: Role-based access across four support tiers and an administrator role, an approval quorum on privileged grants, session and role guards at the endpoint, and pre-execution audit records so failed writes leave evidence.
- Workflow automation: An engine defining automations as triggers, conditions and actions executed against real system events, so approval routing, escalation and notification follow readable business rules.
- Data model: Over 300 tables and views with typed polymorphic relationships, including a double-entry general ledger whose trial balance reconciles, with integrity enforced at database level.
- Local-first AI: A resident assistant on its own **llama.cpp** inference engine, with a cloud fallback chain of Gemini, Groq and Claude; two-pass retrieval over ChromaDB with cited resolution notes; tool calls under a constrained grammar; and generated SQL validated against a schema allow-list and executed through a read-only account.
- **Privacy by design:** Every outbound prompt passes a PII redaction layer with a hash-based audit, and any privileged action above a defined blast-radius threshold is escalated to a person before it runs.
- Method of delivery: Built against a roadmap of over 1,400 numbered improvements, prioritised through WSJF and RICE, and shipped one verified change at a time behind a pre-commit gate, with every change in Git.
- Directory connector: A read-only Active Directory integration over LDAPS, built against a Windows Server 2025 domain and an AD CS enterprise root CA set up for the purpose: groups mapped to teams and roles on objectGUID, a dry run that previews every change, soft deactivation rather than deletion, and an append-only audit written by database triggers.
- Reporting and KPIs: A report builder from a plain-language question to a validated query to a rendered PDF, and KPI dashboards drawn with a hand-written canvas charting library.
- **Recorded walkthroughs:** Five episodes on YouTube, from causal reasoning through retrieval to text-to-SQL: episode 1, episode 2, episode 3, episode 4, episode 5.

09 SELECTED WRITING // /blog

- Every Gate is Ordinary Code: every control between a request and a database row in a built system, on the principle that readable gates remain repairable gates.
- Form as Firewall: generated queries validated against a schema allow-list and executed through a read-only account, never through the application's own credentials.
- A Defence-in-Depth Approach to Data Protection: data leakage to external services treated as a problem of architecture, with every outbound request passing a controlled, audited point.
- Multi-Cloud Architecture for Financial Services: an IT strategy study for an active-active platform across AWS and Azure, with each layer's failure mode and a phased rollout.
- A Wise CTE, IT Governance in Database Updates: changing production data safely, from staging tests and a backup of affected rows to a rollback limited to the rows that changed.

10 LANGUAGES, ELIGIBILITY & MORE // meta

Languages	English (full professional proficiency) | Assamese (mother tongue) | Hindi | German (A1/A2)
Eligibility	Indian national, resident in The Hague on a Highly Skilled Migrant residence permit, which moves to a new recognised sponsor. Available from January 2027, or earlier upon agreement.
Methods	Agile and Scrum; Git-based delivery; ITIL; BPMN; MoSCoW, WSJF and RICE; object-based effort estimation.
Systems	Microsoft Dynamics 365 with Power Apps and Power Automate; Unit4 ERP; ServiceNow; Jira and Confluence; Power BI; Azure Data Lake.
Certification	ITIL 4 Foundation in progress.
